

US National Telecom (USNT) - Packetrino Softswitch Outperforms Expectations

Packetrino, an investment of US National Telecom (Pinksheets: USNT) outperforms specifications and readies for second installation.

June 10, 2008 (FPRC) --

Packetrino is designed as softswitch technology for the VoIP telecom carrier which needs more capacity with fewer servers. Smaller carriers now have an alternative to very expensive load balancers with SIP registration features that require many backend servers. Now, with the Packetrino Load Balancer/Registrar a VoIP telecom carrier can deploy only a few inexpensive Asterisk servers along with \$19,950 Packetrino pair of servers to achieve high capacity call volume for a fraction of the normal cost.

The first installation at a VoIP carrier has gone smooth, and Packetrino is getting ready to make a second installation before the end of June, 2008.

Packetrino team of dedicated developers is continuing the development path towards releasing a full-featured softswitch with routing, rating and billing all carrier-grade. That full version, the first of which will be ready by Fall 2008, will sell for about \$65,000 depending on port licenses.

The current share structure of USNT is 460,083,750 shares outstanding with 240,763,800 Restricted and 2,000,000 Preferred shares.
