

eZdia Launches Online Payment and Project Posting systems

With the release of the online payment system and project posting feature eZdia has become a more attractive platform for experts and employers

April 5, 2010 (FPRC) -- eZdia launches the updated version of eZdia platform which includes the online payment and project posting features. This release also includes some of the newly redesigned user interfaces based on the feedback from the beta test by a selected set of users. These changes make the site user friendly to navigate, search for the needed information, and also to interact with the experts to get their customized answers and solutions.

The platform now offers a way for experts to monetize their expertise and at the same time provides an efficient way for solution seekers to get their questions answered and have their projects executed by experts.

eZdia Inc.

eZdia is an online platform that brings together seekers and providers of knowledge and contract services – which can be provided for free or sold for a negotiated fee. By leveraging its proprietary technology, eZdia not only ensures that the sellers of knowledge and services are reliable, but also presents the most relevant providers to individual solution seekers. In addition, the eZdia 'Knowledge Bucket' feature allows users to post propriety & web contents for providers/knowledge seekers to identify and address.

eZdia's patent pending technology provides a platform that validates and ranks the reliability (expert level) of knowledge and services providers. The validation/ranking technology is able to not only deliver experts related to specific subjects, but also factors in the relative degrees of separation of the expert from the buyer.

The eZdia platform has been built with completely open source software, and uses open standards for seamless integration with various customers and third party applications created by users.
