

Advanced AJAX Testing - Free Educational Webinar

*Test Complex AJAX Applications Quickly and Efficiently
Regression Tests, Monitoring Runs, Extreme Reliability
Meet SLA Monitoring Requirements With Ease*

April 14, 2010 (FPRC) -- San Francisco, CA. Software Research Inc., the leader in automated testing of web applications, today announced an Advanced AJAX Testing webinar, scheduled for April 21.

Many QA/Testing groups face the often daunting task of qualifying complex AJAX web applications, within severe budget and time constraints. Either for functional behavior confirmation or for on-going SLA monitoring.

The biggest problem in testing AJAX is assuring that tests play back reliably -- and the biggest obstacle is the essential asynchronous operation of an AJAX application. Scripted wait times are unreliable and always cause problems. The solution is to use DOM-based playback synchronization -- a unique eValid capability.

In this webinar you'll learn how special eValid commands overcome problems with variable-time playback dependency by synchronizing on internal AJAX application page properties. You'll learn how to find a pivot object on a page, how to use eValid's structural commands to focus on the right action element, how to issue the action, how to choose the correct DOM synchronization command, and how to confirm that effective playback synchronization has been obtained.

"With these techniques, you'll see how eValid becomes a real force amplifier in your company's web application testing. Resilient eValid tests are simple and fast, realistic yet precise, accurate and reliable. An easy way to meet SLA requirements, " stated Dr. Edward Miller, CEO of Software Research. " You are cordially invited to attend this free Webinar."

Key Facts:

* When: Wednesday, 21 April 2010, 2:00PM Eastern Time - 11:00 AM Pacific Time
