

Liver Cancer Cure Now Announces the Cancer Cure that You Can't Have

The shocking truth is that the pharmaceutical companies and the Food and Drug Administration are not interested in health. Money and power are their focus.

August 2, 2010 (FPRC) -- Liver Cancer Cure Now's General Manager, Rick G. House, announced today "Cancer has been cured. The FDA and Big Pharma are afraid that this might become common public knowledge, threatening their trillion dollar industry. Dichloroacetic Acid, also known as DCA, has been proven to kill cancer cells, while having absolutely no effect on healthy cells". But DCA's biggest crimes are:

Costing pennies per dose, it would make current treatments (which Big Pharma has spent hundreds of millions of dollars developing) obsolete.

Able to wipe out the enormous profit streams (radiation, chemotherapy, surgery, expensive drugs) at the same time.

Being non-patentable, Big Pharma won't touch it.

For these reasons, DCA will likely never be made available to the public. The FDA is funded by Big Pharma, so obviously there will never be a safe, effective, inexpensive cure approved by the FDA. That would be biting the hand that feeds them.

Discovered by Dr. Evangelos Michelakis, DCA has no side effects. Compare that to the "cut, burn & poison" approach taken by our modern medical establishment. Dr. Michelakis said: "You typically get this Eureka kind of feeling, and it's actually the most exciting thing a scientist can get". Now the problem is funding. Dr. Michelakis is looking for someone to provide the \$100,000,000.00 typically required to get a drug to market.

Mr. House further commented: "Fortunately, there are other safe and inexpensive cancer cures. And due to the freedom of information provided by the internet, the FDA is not able to prevent the public from finding them".
