

## **At Last a Solution for Recycling Litter!**

*What to do with litter has been a problem for many years. It all currently goes to landfill as it has been too complicated to recycle it. Litter Glue solves this problem and turns this material simply into valuable product/s*

October 17, 2011 (FPRC) - In the UK we are not very good at recycling as in reality we make it too complicated and with many every day disposable goods we actually have no recycling solutions at all. Without shipping to third world countries for manual segregation our last remaining landfill sites would be over run within weeks.

New cost effective solutions have to be found that not only cost less but actually produce a valuable and useful product.

With the ever growing consumer led demands in recent years there are currently no recycling solutions for a massive list of everyday goods which actually becomes litter or waste!

With LITTER GLUE we have created a very simple solution that for the 936 everyday items that there is no solution to can now be recycled in minutes into pathways, walls, bollards, garden furniture and many other useful products. With absolutely NO SEGREGATION they do not even have to be clean!! So simple even with poor DIY abilities a product could be formed.

So what are these 936 items – well items such as

- Carrier bags
- Chocolate wrappers
- Fast food containers
- Plastic wrapped newspaper inserts
- Prepared food containers- even including remnants of food
- Dog waste
- Cat litter
- Cigarette ends and packets
- Chewing gum
- Cotton buds and other toiletries
- Expired bank cards
- Cheese wrapping
- Laminated plastics
- Food waste
- Metalised plastics
- Bicycles
- Broken children's toys
- Videos
- Vinyl records
- Coat hangers
- DVDs

And many more!

Of course added to this in litter there are many items which could be recycled if they were in correct recycling bins but the good news is they can also be used in litter glue without ANY form of segregation.

These can all be crushed mixed with litter glue and poured into either a mould used to repair pathways/pavements or create new ones. Within hours fully dried and can be painted or top coated with gravel- this is purely for cosmetic purposes.

Job done and all at less cost than landfill
